## UNIVERSITY OF COLOMBO SCHOOL OF COMPUTING

DEGREE OF BACHELOR OF INFORMATION TECHNOLOGY (EXTERNAL)

Academic Year 2011/2012 -3<sup>rd</sup> Year Examination - Semester 6

## IT6404 - Database Systems II Structured Question Paper

3<sup>rd</sup> August, 2012 (TWO HOURS)

| To be completed by     |
|------------------------|
| <br>BIT Examination In |
| <br>BII EXAMINACION IN |

## **Important Instructions:**

- The duration of the paper is 2 (two) hours.
- The medium of instruction and questions is English.
- This paper has 4 questions and 14 pages.
- Answer all questions (25 marks each).
- Write your answers in English using the space provided in this question paper.
- Do not tear off any part of this answer book.
- Under no circumstances may this book, used or unused, be removed from the Examination Hall by a candidate.
- Note that questions appear on both sides of the paper.
   If a page is not printed, please inform the supervisor immediately.

Indicate by a cross (x), (e.g. |x|) the numbers of the questions answered.

|  | Ques | tion nun | nbers |   |  |
|--|------|----------|-------|---|--|
| To be completed by the candidate by marking a cross (x). | 1    | 2        | 3     | 4 |  |
| To be completed by the examiners:                        |      |          |       |   |  |

| 1) (a) (i) Define the following term | ms. |
|--------------------------------------|-----|
|--------------------------------------|-----|

Seek Time, Rotational Delay (Latency), Transfer Time and Access Time.

| (04) | marks) |
|------|--------|
|------|--------|

| ANSWER IN THIS BOX  | mai K |
|---|-------|
| Seek Time - Average time to move the read-write head to the correct cylinder.     |       |
| Rotational Delay - Average time for the sector to move under the read-write head. |       |
| Transfer Time - Time to read a sector and transfer the data to memory.            |       |
| Access Time - Access time = seek time + rotational delay + transfer time          |       |
|   |       |
|   |       |

(ii) Processing time is measured in nanoseconds, milliseconds or seconds. Give the most suitable time measurement unit for Seek time, Rotational delay and CPU cycle time respectively.

(02 marks)

| ANSWER IN THIS BOX           |                                   |
|------------------------------|-----------------------------------|
| Seek time - milliseconds     | Rotational delay - <b>seconds</b> |
| CPU cycle time - nanoseconds |                                   |
|                              |                                   |

(b) What are the differences between sequential file organization and direct file organization?

**(03 marks)** 

| ANSWER IN THIS BOX                      |  |
|---|--|
| Sequential file organization            | Direct file organization                 |
| File accessed in order, one record at a | File is accessed in any order, by record |
| time, from first to last.               | number.                                  |
|   |  |
| Each record can be of varying length.   | Each record must be of identical length. |
|   |  |

| Index | No:  |      |      |  |
|-------|------|------|------|--|
| mucx  | INO. | <br> | <br> |  |

(c) Eight records are entered in the given order as Record-C, Record-G, Record-B, Record-A, Record-H, Record-E, Record-F and Record-D respectively, where A-H are key values. Following three figures represent examples of how these records are stored on disk.

| Record-C |

Figure 1a

Figure 1b

Figure 1c

- (i) What type of file organisation does each figure represent?
- (ii) Explain how each of these files would have been constructed.

(06 marks) **ANSWER IN THIS BOX** Figure-1a – **Serial file (Unordered file)** Unordered files are constructed by appending new records to the end of the file. Figure-1b – Sequential file (Ordered file) Ordered files are maintained by physically rearranging the file in the order of the key values. Figure-1c - Index sequential file Index sequential file maintains a full index to locate its unordered file records. (e.g. figure 1a). Index entries are ordered by key values and corresponding record identification is maintained as in figure 1c.

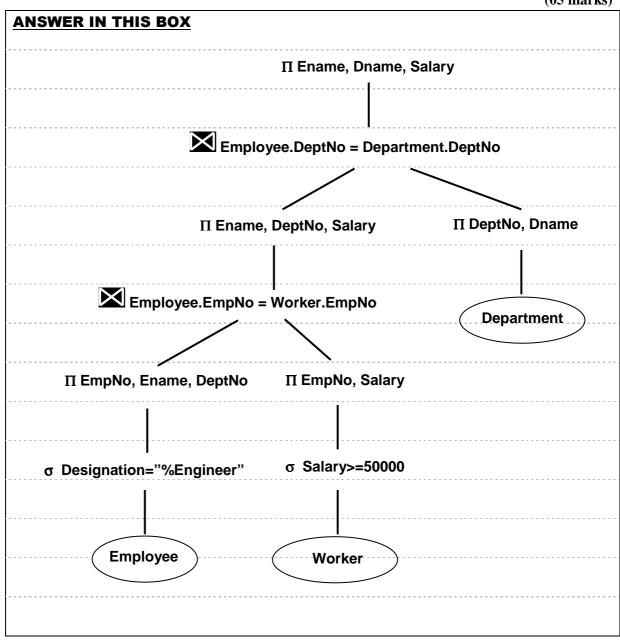

| The above query would retrieve all employees' names, department and salary who designations end with Engineer and being paid a salary of 50,000 or above.  Briefly explain how the above SQL statement would initially be represented internally relational operators prior to the query optimisation process.  |   |

|---|-----------|----|---|-------|---------------|---------|--------|-----|-----------|----------|--------|
| ) | employees | at | a | small | merchandising | company | access | the | corporate | database | relati |

(c) Two employees at a small merchandising company access the corporate database relation Items(ItemtNo, Name, UnitPrice, Quantity) at the same time. The first person is the company's Sales Manager. The second is the Accountant.

The Sales Manager wants to increase the price of a shirt sold by their firm by Rs. 10%, but is having a little trouble with the syntax of the SQL language (i.e. uses UnitPrice = UnitPrice\*0.10 instead of UnitPrice = UnitedPrice\*1.10). At the same time, unknown to the Sales Manager, the Accountant is trying to calculate the retail value of the current inventory to be included in a report that he volunteered to bring to the next management meeting (i.e. SUM(Quantity\*UnitPrice)). Sales Manager having retrieved the new unit prices of shirts realized the error he had made and corrects it through a rollback followed by a correct execution of the update statement to increase the unit price of a shirt.

(i) Give a schedule for the above scenario identifying the full SQL statements issued by the two transactions T1 (Sales Manager) and T2 (Accountant).

|  | (06 marks)                            |
|--|---------------------------------------|
| ANSWER IN THIS BOX   |                                       |
| T1: UPDATE Items SET UnitPrice = UnitPrice*0.10                    | WHERE Name="shirt";                   |
| T2: SELECT SUM(Quantity*UnitPrice) FROM Items                      | s;                                    |
| T1: SELECT * FROM Items WHERE Name="shirt";                        |                                       |
| T1: ROLLBACK;  |                                       |
| T1: UPDATE Items SET UnitPrice = UnitPrice*1.10                    | WHERE Name="shirt";                   |
| T1: SELECT * FROM Items WHERE Name="shirt";                        |                                       |

|       |     |  |  |  |  |  |  |  |  |  |  |  |

- (e) Type constructor *row* is used to specify complex types known as user-defined types.
  - (i) Give an example to specify a row type for an address that would include street, city and zip.

**(03 marks)** 

| ANSWER IN THIS BOX        |  |
|---------------------------|--|
| CREATE ROW TYPE Address ( |  |
| Street VARCHAR(25),       |  |
| City VARCHAR(20),         |  |
| Zip VARCHAR(9));          |  |
|                           |  |

(ii) Show how this row type address can be used to create a Customer table having customer-id, customer-name, customer-address and phone number.

(03 marks)

| ANSWER IN THIS   | ROY           | (US IIIai KS) |
|------------------|---------------|---------------|
| ANOWEK IN THIS   | <u>BOX</u>    |               |
| CREATE TABLE Cus | tomer (       |               |
| Customer-ID      | CHAR(10),     |               |
| Customer-Name    | VARCHAR(25),  |               |
| Customer-Address | Address,      |               |
| Phone            | VARCHAR(15)); |               |
|                  |               |               |
|                  |               |               |

(f) In the table given below, **Column I** contains typical functions of a Data Warehouse. **Column II** lists description of some data warehouse functionality.

|   | Column I       |   | Column II   |
|---|----------------|---|---|
| Α | Roll-up        | 1 | Data is available by value or range.                    |
| В | Drill-down     | 2 | Performing projection operations on the dimensions      |
| С | Pivot          | 3 | Cross tabulation is performed.                          |
| D | Slice and dice | 4 | Data is summarised with increasing generalization.      |
| Е | Selection      | 5 | Increasing levels of details are revealed.              |
|   |                | 6 | Attributed are computed by operations on stored values. |
|   |                | 7 | Data is sorted by ordinal value.                        |

Match each function from  $Column\ I$  with the most appropriate description in  $Column\ II$ . Write your answer in the box given below.

Briefly explain the range of distribute environments.&lt;/td&gt;&lt;td&gt;&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;ANSWER IN THIS BOX&lt;/td&gt;&lt;td&gt;(08 marks)&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;&lt;/td&gt;&lt;td&gt;&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;Organizations may use homogeneous or heterogeneous environments.&lt;/td&gt;&lt;td&gt;&lt;/td&gt;&lt;/tr&gt;&lt;tr&gt;&lt;td&gt;C&lt;/td&gt;&lt;td&gt;Continued&lt;/td&gt;&lt;/tr&gt;&lt;/tbody&gt;&lt;/table&gt;</title> |        |

| ĺ | Index No:  |            |
|---|--|------------|
| ٠ | Homogeneous - The same DBMS is used at each node.  |            |
|   | It can be Autonomous where each DBMS works independently,  |            |
|   | passing messages back and forth to share data updates OR   |            |
|   | Non-autonomous where a central or master DBMS coordinates database acce                          | ess        |
|   | and updates across the nodes   |            |
|   | Heterogeneous - Potentially different DBMSs are used at each node.                               |            |
|   | Distributed systems support some (partial Multi-database) or all of the function                 | onality    |
|   | of one logical database.   |            |
|   | Federated databases support local databases for unique data requests which                       | are        |
|   | loosely (many schemas exist, for each local database) or tightly (one global schema) integrated. |            |
|   | What are the basic strategies for distributing data among the sites (or nodes) of a network?     | (03 marks) |
|   | ANSWER IN THIS BOX   |            |
|   | Data replication   |            |
|   | Horizontal partitioning  |            |
|   | Vertical partitioning  |            |
| Ì | Combinations of the above  |            |

\*\*\*\*\*
